

EASAV

EASAV presents a lecture and wet lab for vets & RVTs

Crucial Procedures for the Emergency Veterinary Team

AbVMA, SVMA & CVBC-approved: Lecture: 1.5 CE credits; Lab: 3 CE credits

Speaker: Marie Holowaychuk DVM, DACVECC, CYT

Seminar Abstract: With veterinary emergency caseloads higher than ever before, long wait times or closed hospitals require that general practice teams handle emergency cases. This increased responsibility for stabilizing and caring for emergent or critical patients requires knowledge and understanding of certain procedures such as stabilizing patients with shock, gastric dilation volvulus (GDV), or respiratory distress and managing patients with feeding tubes.

During the lecture portion of this session, videos and commentary will be used to demonstrate techniques most commonly used in the ER setting, such as intraosseous catheter placement, pericardiocentesis, thoracocentesis, chest tube placement, orogastric intubation, gastric trocarization, as well as nasal and esophagostomy feeding tube placement. These procedures, as well as venous cutdown, will also be demonstrated and practiced during the laboratory cadaver portion of this session. Veterinarians and RVTs are encouraged to attend and will gain confidence to prepare for or perform these tasks in the general or emergency practice setting.

About our speaker: Dr. Marie Holowaychuk graduated from WCVU in 2004 and after a 3 year residency at North Carolina State University, became board certified in small animal emergency and critical care in 2008. She taught for 5 years at the OVC, has co-authored more than 25 veterinary publications and is world renowned as a continuing education speaker. Over the past 10 years, in addition to working as an educator and locum vet, Marie has obtained certification with numerous mental health certificates and made it her mission to increase awareness about mental health and wellbeing within the veterinary profession.
